ABSTRACT:

This project proposes to build an LMS integration platform that delivers a smart and interactive learning experience for both students and faculty. Students can seamlessly upload assignments through a structured interface along with accessing subject-wise marks visualization, trend analysis, weak topic detection, and AI-powered study suggestions. Faculty members are equipped with an efficient assignment grading system along with class performance overviews, at-risk student identification, and question-wise performance analysis. The platform incorporates AI-powered features including automatic quiz generation from notes, PDF summarization, personalized study recommendations, and a course-based doubt assistant chatbot for students. A smart notification system ensures timely alerts for assignment deadlines and low score warnings through both email and in-app notifications. Role-based access control manages secure and structured interaction between administrators, instructors, and learners. Overall, this solution aims to make digital education more intelligent, data-driven, and outcome-focused for all stakeholders.
